MRI BRAIN (PLAIN AND CONTRAST)

Patient Name	**: Mrs. Lakshmi Venkatesh**	Accession No.	: VH-MR-26-09121
Age / Sex	: 66 Y / Female	Modality	: MRI 3T
Patient ID	: LCM-10240	Study Date	: 12/09/2026
Referred By	: Dr. Ananya Rao	Reported	: 12/09/2026 01:30 PM

CLINICAL DETAILS

Headaches for 3 months; one episode of left arm jerking with loss of consciousness on 6 Sept.

TECHNIQUE

Multiplanar multisequence MRI with T1, T2, FLAIR, DWI, SWI and post-gadolinium T1 images on a 3T scanner.

FINDINGS

A well-defined extra-axial dural-based lesion over the right frontal convexity measuring 4.2 x 3.6 x 3.4 cm. It is isointense on T1, mildly hyperintense on T2 and shows intense homogeneous enhancement with a dural tail. CSF cleft partially preserved. Mild perilesional vasogenic oedema; 4 mm midline shift to the left. No restricted diffusion. Rest of the brain parenchyma, ventricles and posterior fossa normal for age.

IMPRESSION

1. **Right frontal convexity extra-axial lesion with dural tail — features typical of meningioma (4.2 cm), with mild mass effect.**
2. **Neurosurgical opinion recommended.**

Kindly correlate clinically. Not valid for medico-legal purposes.
